🐙 github.com/TaQsiimTQ

Summary

Mobile Developer with expertise in architecting high-performance native (Android/Kotlin) and cross-platform (Flutter/KMP) ecosystems. Android and Flutter developer (Kotlin, KMP) with hands-on experience shipping a BLE-connected AI health app and a 2,500-user campus platform. Passionate about on-device ML and cross-platform architecture.

Education

Egypt-Japan University for Science and Technology

Sep 2023 – July 2027

Bachelor of Science in Computer Science and Information Technology

Alexandria, Egypt

Experience

Digital Egypt Pioneers Initiative (DEPI)

June 2025 – Nov 2025

Mobile Application Development Trainee

Egypt

- Built AnimBro end-to-end as the program's flagship deliverable — architected API integration, reactive UI in Jetpack Compose, and offline-first data layer under production code review
- Applied MVVM architecture and Clean Architecture principles to ensure scalability and maintainability across all production-level applications developed during the program.

Projects

AnimBro | *Kotlin, Jetpack Compose, Firebase, MyAnimeList API, Retrofit*

[🐙 GitHub](#)

- Developed a comprehensive Android application for anime discovery and tracking, utilizing Jetpack Compose for a modern, reactive, and highly responsive user interface.
- Integrated MyAnimeList v2 API using Retrofit and OkHttp to sync user watchlists, ratings, and statuses (Completed, Dropped, Plan to Watch) in real-time.
- Engineered a local data persistence layer to manage favorites and wishlists, ensuring a seamless user experience even with intermittent network connectivity.

CampusConnect | *Kotlin, Jetpack Compose, Retrofit, Firebase, MVVM*

[🐙 GitHub](#)

- Architected a multi-role mobile platform for campus management, scaling the application state management to seamlessly support concurrent users with low response times.
- Implemented unidirectional data flow using MVVM, which cut UI state-related bugs and accelerated the deployment of new manager workflows.
- Engineered specialized, real-time Firebase synchronization pipelines for administrative users, boosting event check-in efficiency and eliminating race conditions.

CardioLogic | *Kotlin, Jetpack Compose, Bluetooth Low Energy (BLE)*

[🐙 GitHub](#)

- Shipped on-device ECG rhythm classification at 45ms inference latency lower battery draw than baseline, enabling real-time cardiac monitoring without cloud dependency
- Engineered a fault-tolerant Bluetooth Low Energy (BLE) communication layer, mitigating hardware MTU limitations and achieving a success rate in continuous data telemetry.
- Designed a custom byte-buffering algorithm to reconstruct truncated hardware packets on the fly, eliminating data fragmentation and improving signal accuracy for the AI model.

Technical Skills

Languages: Kotlin, Dart, Python, C/C++, JavaScript, HTML/CSS

Frameworks & Libraries: Jetpack Compose, Flutter, Kotlin Multiplatform (KMP), Firebase, Retrofit

Architecture & Concepts: Clean Architecture, MVVM, Kotlin Coroutines, Hilt, Jetpack Navigation, room, Object-Oriented Programming (OOP), RESTful APIs, Agile/SDLC

Developer Tools: Android Studio, VS Code, Git/GitHub, Arch Linux.
